Brief Abstract

Description

This measure is used to assess the percent of patients with a documented screening for depression in the past 12 months.

Rationale

Asthma is a chronic lung condition that increasingly is being recognized as a major international public health challenge. But although asthma is a chronic respiratory disease, much can be done to manage the symptoms. Never before have we had so many good, safe oral and inhaled drugs for the treatment of asthma as we do today. Evidence-based guidelines have been proven to be effective in improving the daily lives of patients with this disease.

Unfortunately, despite our progress, we know that many individuals with asthma still suffer unnecessarily from the symptoms of disease. Guideline implementation lags in many practices across the country. In a healthcare system designed around acute care, chronic illnesses including asthma are not managed as effectively as they could be. Translating research into practice is not as easy as it sounds, even when we know it is the right thing to do.

The Asthma Collaborative is designed to help healthcare providers improve the care they provide to people with asthma. Focusing on specific measures that are based on clinical guidelines, practices concentrate on changes that truly make a difference. By providing tools and proven strategies to change the way asthma care is delivered, the Asthma Collaborative has improved the lives of thousands with asthma.

This measure is one of 11 measures that participants track in the HRSA Health Disparities Collaborative for Asthma.

Primary Clinical Component

Asthma; depression; screening

Denominator Description

Total number of patients with asthma in the registry

Numerator Description

The number of patients from the denominator with a documented screening for depression in the past 12 months

Note: The instrument(s) or method(s) to be used for screening needs to be specified. The HRSA HDC Collaboration for asthma recognizes that depression screening for children differs from depression screening for adults.

Evidence Supporting the Measure

Evidence Supporting the Criterion of Quality

A clinical practice guideline or other peer-reviewed synthesis of the clinical evidence

A formal consensus procedure involving experts in relevant clinical, methodological, and organizational sciences

A systematic review of the clinical literature

One or more research studies published in a National Library of Medicine (NLM) indexed, peer-reviewed journal

Evidence Supporting Need for the Measure

Need for the Measure

Use of this measure to improve performance

Stratification by Vulnerable Populations

Characteristics of the Primary Clinical Component

Incidence/Prevalence

Asthma affects between 14 and 15 million people in the United States alone. There are 4.8 million children with asthma in the U.S. During the past 15 years, its prevalence around the world has doubled.

Evidence for Incidence/Prevalence

Association with Vulnerable Populations

In the U.S., rates of asthma deaths, hospitalizations, and emergency department visits have been increasing for more than two decades, especially among African Americans and children. Since 1979â€"82, the average age-adjusted asthma death rate for blacks has increased 71 percent versus 41 percent for Caucasians, and in 1995â€"98, the death rate was almost three times that of Caucasians.

Similarly, between 1992 and 1998, rates of emergency department visits for asthma increased, with the greatest increase in children ages 10â€"17. Children under 5 accounted for the highest rates of emergency department visits. Hospitalization rates also rose during this time period. Between 1979â€"81 and 1997â€"99, hospitalization rates for children under 5 increased 48 percent. In 1997â€"99, hospitalization rates were more than three times higher for African Americans than for whites.

Evidence for Association with Vulnerable Populations

Institute for Healthcare Improvement. Health Disparities Collaboratives changing practice, changing lives: asthma training manual. Cambridge (MA): Institute for Healthcare Improvement; 2002. 71 p.

Burden of Illness

In 2000, there were 100 million total days of restricted activity among persons with asthma and 5,000 deaths of asthma.

See also the "Association with Vulnerable Populations" field.

Evidence for Burden of Illness

Institute for Healthcare Improvement. Health Disparities Collaboratives changing practice, changing lives: asthma training manual. Cambridge (MA): Institute for Healthcare Improvement; 2002. 71 p.

Utilization

In 2000, the annual hospitalization rate among persons with asthma was 470,000.

See also the "Association with Vulnerable Populations" field.

Evidence for Utilization

Institute for Healthcare Improvement. Health Disparities Collaboratives changing practice, changing lives: asthma training manual. Cambridge (MA): Institute for Healthcare Improvement; 2002. 71 p.

Costs

The total cost of asthma in 2000 was estimated to be \$12.7 billion, with direct medical costs amounting to \$8.1 billion and lost earnings due to illness and death totaling \$4.6 billion.

Evidence for Costs
